

# Colloidal Silver

Trance Form

## *What is it?*

Colloidal silver or Silver Water is a solution of silver in water. A colloidal particle is the smallest possible particle of a substance which still has the characteristics of the substance, in this case silver. The silver particles are so small (0.001 to 0.0015 micron) that they float freely in the water.

Since ancient times, the disinfectant effect of silver has been traditionally known and pharmacists produced colloidal silver through a process of filtration. When it became common to use antibiotics around the 1940, colloidal silver fell into disuse because of its decentralized production appeared to be difficult to patent.

Today however, it is back in public attention because of the direct bacterial, viral and fungicidal effect. Nowadays the production method is simpler and cheaper, by using a physical-chemical process with electrical discharges. Officially it is not a medicine but a food supplement that can support the resistance of people, animals and plants without side effects. It can be used for prevention as well for fighting acute and chronic diseases.

In addition it can be used as a disinfectant agent in the toilet, bathroom, for combs, in the kitchen, to keep fresh vegetables and fruit and to leave the refrigerator fresh and clean.

## *Desintoxification*

During the start of intake some detoxification reactions can appear in the form of flu-like symptoms, fatigue, headaches and diarrheas. These temporary symptoms are caused by toxins in the body which are released and circulate through the body before being excreted.

## *Dosage*

Opinions are divided about the concentrations and frequencies. Not everyone reacts the same because the silver works in cooperation with your own immune system. A general guideline is this:

For **prevention**, a low concentration (10-25 ppm) is used: 3 teaspoons a day for an adult of average weight, children and animals in proportion.

To fight **acute infections** you can temporarily use slightly higher concentrations (40 ppm) in a higher frequency (3 x 3 teaspoons a day).

For **relief of persistent chronic immune problems**: high doses in high concentrations (200 ppm). You should only do this while supervised by a doctor or therapist with experience with colloidal silver.

When you prolong the use of high concentrations it is important to take a supplemental of **Selenium**, which is degraded in the body by the presence of silver.

## *External use*

Apart of intake, Colloidal silver is very effective when used directly on affected areas. It can be used external by dripping with a pipette, spray or being applied on paper towels or cotton pads.

Examples of direct use are sniffing a few drops to fight sinusitis, gargling several times a day in case of throat inflammation and keep it as long as possible in the mouth for inflamed or irritated gums.

Skin conditions caused by bacteria you can spray or leave a wet tissue or cotton about 10 minutes on the affected area. Infections of the genital/urinary tract can be treated the same way.

Coloidal Silver is also useful a disinfectant (iodine) in case of cuts, scratches and insect bites.

You can support this external treatment by internal use.
